maxmail® LIVECRM LIVEAmbassador

API Usage

This Maxmail Public API is accessible to current Maxmail customers only. This is not an open source API for creating application mashups and does not support any third party integration with other software applications.

This script can operate in 2 main modes:

URL Redirect mode: In this mode the script will execute and then redirect the browser back to a specified URL, you can specify a URL for successful subscriptions and a URL for failed subscriptions. This mode is best for websites that will use either a server-side redirect or a JavaScript redirect.

Non URL Redirect mode: In this mode the script will simply execute and return either "ok" or "failed". This mode is best for websites which need a complete server-side solution and do not wish to redirect the users' browser. e.g using the PHP http_request object or the .NET HttpRequest object.

The script takes the following parameters (**GET or POST method**)

Field Name	Possible Values	Notes
urlredirect	y OR n	
glid	Required	We will provide you with this value
mailing_list	Required	We will provide you with this value
success_url	URL containing http:// prefix	Required if urlredirect set to y
fail_url	URL containing http:// prefix	Required if urlredirect set to y
first_name	Required	
email_address	Required	
company_name	Optional	
last_name	Optional	
phone_number	Optional	

If no success URL is supplied, Maxmail will auto redirect to a default landing page with Maxmail branding.
